## 11. EPIDEMIOLOGY AND LABORATORY CAPACITY STRENGTHENING

Hi Supervisors,

You mention COVID - a dead issue and a disappearing disease, like SARS and MERS coronaviruses. The vax was a quick fix, 6 months & less, with horrible side effects for EVERYONE (MIS and myocarditis, and now SADS - so sad!) Then, reporting on COVID turned out to be wrong from the CDC on down. You even had to impose mandates because we knew that the medicine didn't work. So now it turns out that you can die with or without. And you say 'follow the science.' Most of us did, but so many exceptions cropped up, that neither the doctors nor we could handle it. This pandemic was totally, repeat, totally mismanaged.

We should have had proper sunlight, ventilaton, and colloidal silver, like the CDC itself said.

Given the unreliability and misuse of current PCR and other tests for COVID, we need to focus on and correct that issue first before we continue with old technology that is easily falsified. For instance, what is the good of a test if the sensitivity can be 'dialed up' to record illness that happened months ago?

Regards,

Paul Henkin
